</table>
BACKGROUND

In order to enhance the operationalization of Common Market for Eastern and Southern Africa (COMESA) Member States’ biotechnology and biosafety policy implementation plan, ACTESA and ISAAA AfriCenter in partnership with PBS supported the review and updating of a brief on the status of biotechnology and biosafety policies in the COMESA region. Although most countries in the COMESA region drafted national biosafety frameworks under the UNEP-GEF Biosafety Project in 2006, only 11 countries in the region have stand-alone biosafety laws. They include: Eswatini, Ethiopia, Kenya, Madagascar, Malawi, Mauritius, Rwanda, Seychelles, Sudan, Tunisia and Zambia. In the period since the development of the frameworks, some countries have progressed through research to commercialization of biotech products, while others have utilized the laws for trade and transboundary movement of GM based commodities. Some countries such as Kenya, Eritrea and Tunisia have had phases of ban decisions on importation of GM foods, exemplifying the need for continued awareness creation efforts and capacity building for enabling policy environments.

COMESA strives to promote regional economic integration through trade and investment. The success of this important goal depends on the harmonization of policies, laws and regulations affecting trade in the COMESA member states. Agriculture forms the backbone of the economies of member countries. An estimated 80% of the population in member countries depend on agriculture for their livelihoods. Furthermore, agriculture accounts for more than 32% of the COMESA gross domestic product and provides 65% of the raw material for industry. The harmonization of biotechnology and biosafety policies within COMESA is therefore, not only desirable but will be indispensable if free trade, especially of agricultural commodities, is to be achieved.
OBJECTIVES OF THE ASSESSMENT
To document the current status of biotechnology and biosafety in COMESA countries with respect to:
1. Biotechnology and Biosafety policies
2. Biosafety Laws or Bills
3. Biosafety implementing regulations and
4. Any other legislation that may have clauses on biotechnology and biosafety.
The assessment was based on information available in the public domain e.g. in the BCH and is not intended for legal interpretation or opinion on compliance with referenced legislation and regulations.

WHY BIOSAFETY FRAMEWORKS FOR COMESA MEMBER COUNTRIES?
All COMESA countries are signatories to the Cartagena Protocol on Biosafety (CPB), a binding international agreement under the Convention on Biological Biodiversity (CBD). They are therefore bound by the provisions of the Protocol which requires countries to establish biosafety procedures for transboundary movement, transit, handling and use of all living modified organisms that may have adverse effects on the conservation and sustainable use of biological diversity, taking into account risks to human health. COMESA member countries have initiated the process of development of biotechnology/ biosafety policies and biosafety frameworks mainly through the United Nations Environment Programme’s - Global Environment Facility (UNEP-GEF). The aim of the frameworks is to ensure that biotechnology is harnessed safely in the context of the members’ development priorities The program was initiated to support countries establish National Biosafety Frameworks (NBFs), promote information sharing and collaboration to assist capacity-building for domestication of the Protocol.

According to UNEP-GEF, main components of a comprehensive Biosafety framework include:
• A government policy on biosafety, often part of a broader policy on biotechnology;
• A regulatory regime for biosafety which could include Acts and regulations;
• A system for handling of notifications or requests for consents to undertake biotech related activities;
• A mechanism for monitoring and inspections; and,
• A system for public information and participation.
Burundi has a population of approximately 12.3 million as of 2024, occupies a landmass of around 27,830 KM2, with approximately 35% of its land being arable. The country’s major agricultural produce includes coffee, tea, maize, sorghum, and cassava.

SEYCHELLES

Seychelles has a population of approximately 98,000 people and a landmass of about 459 KM². The country relies on its marine resources due to limited arable land. The country’s major agricultural produce includes fish, coconuts, and cinnamon.

Products: Tobacco, maize, cotton |
| Main Agricultural imports and countries sourced | Source countries: South Africa, Zambia, Botswana, Malawi  
Products: Maize, wheat, sugar |
| Key Biotech Challenges | Low human and infrastructural capacity, low public awareness, weak enabling policies and lack of financial investments |
Biotechnology presents significant opportunities for advancing agriculture across African regional economic blocks such as COMESA. Genetically modified (GM) products, may be harnessed countries can enhance resilience, increase yields, and effectively tackle food security challenges amidst changing climatic conditions and limited arable land. GM crops offer the potential to develop varieties that are drought-resistant, pest-resistant, and nutrient-enriched, thereby improving agricultural productivity and ensuring food availability for growing populations. Furthermore, adoption of GM crops aligns with global agricultural standards, opening doors for increased trade opportunities and reducing dependency on food imports during times of scarcity. Emphasizing biotechnological innovation can also pave the way for sustainable agricultural practices that conserve resources and mitigate environmental impacts, promoting long-term agricultural sustainability and economic growth.

Despite the potential benefits, several challenges hinder the widespread adoption of GM-based commodities across COMESA. A primary obstacle is the persistently negative public perception and low awareness regarding biotechnology. Misconceptions about the safety and environmental impact of GM products often lead to resistance from consumers, civil society organizations, and policymakers. Weak or outdated biosafety policies and regulatory frameworks further complicate the approval process for GM products, delaying their introduction into markets. Insufficient human and infrastructural capacity in biosafety management, research, and agricultural extension services also pose significant barriers. These challenges collectively impede the timely realization of the agricultural and economic benefits associated with GM technology, hindering progress towards food security and sustainable development goals.

To overcome these challenges and capitalize on the opportunities presented by biotechnology, African countries must adopt a multifaceted approach. First and foremost, there is a critical need to enhance public engagement and education on biotechnology. Transparent communication campaigns stand to effectively address misconceptions and build public trust in the safety and benefits of GM products. Simultaneously, governments should prioritize the review and updating of biosafety laws and regulations to streamline approval processes while ensuring rigorous safety assessments aligned with international standards. Investing in capacity building is essential, including training programs for biosafety officials, researchers, and agricultural extension workers. Strengthening regional collaboration and harmonization of biosafety regulations can facilitate intracontinental trade of GM products and enhance regional food security. Moreover, sustained investment in biotechnological research and innovation is crucial to developing locally adapted GM products tailored to regional agricultural challenges and consumer preferences.
